USING THIS MANUAL

A. INSTALLATION SEQUENCE

Follow the installation instructions provided in this manual in the order shown. The order of these instructions has been set in order to provide the installer with a logical sequence of steps that will minimize potential interferences and maximize safety during boiler installation.

B. SPECIAL ATTENTION BOXES

Throughout this manual special attention boxes are provided to supplement the instructions and make special notice of potential hazards. The definition of each of these categories, in the judgement of PB Heat, LLC are as follows:

- **DANGER**
  - Indicates a condition or hazard which will cause severe personal injury, death or major property damage.

- **WARNING**
  - Indicates a condition or hazard which may cause severe personal injury, death or major property damage.

- **CAUTION**
  - Indicates a condition or hazard which will or can cause minor personal injury or property damage.

- **NOTICE**
  - Indicates special attention is needed, but not directly related to potential personal injury or property damage.
# PRODUCT SAFETY & INFORMATION

## DANGER

**HOT WATER CAN SCALD!**

- Water temperatures over 125°F can cause severe burns instantly or death from scalding.
- Children, disabled and elderly are at highest risk of being scalded.
- Never leave them unattended in or near shower, bathtub or sink.
- Never allow small children to use a hot water faucet or draw their own bath.
- If anyone using hot water in the building fits the above description or if local codes or state laws require specific water temperatures at hot water faucet, it is recommended:
  - to install a thermostatic mixing valve at this appliance or at each water faucet.
  - or
  - to set the thermostat knob for the lowest temperature which satisfies your hot water needs.
- Water drained from the system drain valves may be extremely hot. To avoid injury:
  - Make sure all connections are tight.
  - Direct water flow away from any person.

## WARNING

Protection must be taken against excessive temperature and pressure!

- Installation of a Temperature & Pressure (T&P) relief valve is required.

## CAUTION

To prevent damage to the inner tank, the installer must:

- Always fill inner tank prior to outer tank and always drain outer tank prior to inner tank.
- Relieve primary system pressure below 15 psig prior to draining inner tank.
1. PREINSTALLATION

A. CODES COMPLIANCE

Water heater installation must conform with the instructions in this manual and where applicable:

- local, state, provincial, and national codes, laws, regulations and ordinances.
- in Canada - CAN / CGA B149.1 or B149.2 Installation Code.

Peerless® Partner® water heaters are exempt from ASME Section VIII, Division 1 Code construction per Interpretation VIII-86-136. Check with local codes for applicability.

B. CODES RESTRICTIONS

1. Single wall heat exchanger in the Peerless® Partner® water heater complies with National Standard Plumbing Code, provided that:
   a. boiler water (including additives) is practically non-toxic, having toxicity rating or class of 1, as listed in Clinical Toxicology of Commercial Products, and
   b. boiler water pressure is limited to maximum 30 psig by approved relief valve.

2. Single wall heat exchangers are permitted under the Uniform Plumbing Code - Paragraph L3.2. and L3.3 if they satisfy all of the following requirements.
   a. The heat transfer medium is potable water or contains only substances which are recognized as safe by the U.S. Food and Drug Administration.
   b. The pressure of the heat transfer medium is maintained less than the normal minimum operating pressure of the potable water system
      
      Exception: Steam complying with section #1 above.
   c. The equipment is permanently labeled to indicate that only additives recognized as safe by the FDA shall be used in the heat transfer medium.

Other heat exchanger designs may be permitted where approved by the Administrative Authority.

C. OPERATING RESTRICTIONS

1. Maximum domestic hot water temperature is 194°F for commercial applications and 140°F for residential applications.

2. Maximum boiler water temperature is 210°F.

3. Maximum working pressure for inner (domestic water) tank is 150 psig.

4. Maximum working pressure for outer (boiler water) tank is 45 psig.

5. pH and chloride limits for water heaters are:
   a. chloride, less than 150 mg/l (ppm)
   b. pH value min. 6 - max. 8

D. LOCATING WATER HEATER

1. This water heater is not intended for outdoor installations.

2. Keep distance between boiler and water heater to a minimum to:
   a. reduce piping heat loss
   b. provide minimal friction loss

3. Locate water heater so that any leakage from the tank or water connections will not cause damage to the area adjoining the water heater or to lower floors in the structure.
   
   When such a location is unavoidable, a suitable drain pan with adequate drainage, should be placed under the water heater.

4. The Peerless® Partner® water heaters are designed for vertical installation only.

⚠️ NOTICE

Peerless® Partner® water heaters will absorb less than 200,000 BTU/hr when domestic water outlet temperature is 210°F and boiler water supply temperature is 240°F. Listed outputs are based on ASME Section VIII Interpretation VIII-1-86-136.

Where recommendations in this manual differ from local, or national codes, the local or national codes take precedence.

⚠️ NOTICE

Any water conditioning system must be installed and maintained in accordance with manufacturer’s specifications.

⚠️ NOTICE

Do not install the water heater on any application if the boiler piping contains non-oxygen barrier tubing or if the boiler piping is considered an “open system”. Exposing the outer tank of the water heater to oxygen contamination will lead to premature tank failure and denial of the warranty.
E. PRODUCT SELECTION

1. The following guidelines apply to residential systems only. For commercial or institutional installations contact your local PB Heat, LLC representative.

2. Determine the quantity of domestic hot water required. Factors to consider:
   a. Estimate typical peak hour demand. Determine the general time of day (morning, noon, evening) when the most hot water is used. Use chart below to determine potential maximum usage.
   b. Estimate unusual peak draw demand. Whirlpool baths, hot tubs, and multiple head showers require large quantities of hot water in a short period of time. Contact fixture manufacturer for quantity of water required. Generally speaking, these circumstances can only be met with larger storage volumes.
   c. Domestic Water Temperature. Most residential usage will be satisfied with 119°F water, the temperature setting recommended by the Consumer Product Safety Commission. Some applications such as laundry and dishwashers may require a higher temperature. Ratings can be improved by increasing Peerless® Partner® thermostat setting and using a mixing valve to temper the hot water to the proper temperature. When temperatures greater than 119°F are required, use a mixing valve at the outlet of the water heater or anti-scald fittings at point of use.
   d. Domestic water priority. First hour ratings may be less than published when boiler output is shared with space heating. Generally a consumer will notice a drop in domestic water temperature before a drop in space heating temperature. Giving domestic water production priority by directing entire boiler output to Peerless® Partner® will maximize domestic water output. However, prioritization controls could result in an unacceptable drop in space heating temperature when large quantities of domestic hot water are used, and a prioritization control malfunction could result in loss of space heating.

3. Multiple Water Heaters. Peak domestic water usage (first hour rating) or unusual peak draw may not be met with a single water heater. Multiple units can be installed as either a bank of tanks acting as a single unit, or as multiple individual units sized and located for specific draw situations.

---

**NOTICE**

The Peerless® Partner® indirect-fired water heater is deemed to be used in a "commercial setting" if at any time the unit is operated at a temperature over 150°F. Refer to warranty for additional information.

---

Total Peak Hour Demand =  __________

---

**DANGER**

Water temperatures over 125°F can cause severe burns instantly, or death from scalds.

Children, disabled, and elderly are at the highest risk of being scalded.

See instruction manual before setting temperature at water heater.

Feel water before bathing or showering.

Temperature limiting valves are available, see manual.
F. RECOMMENDED CLEARANCES

1. Water heater should be installed to allow adequate clearance for servicing.

2. Zero clearance is permissible to any side of the Peerless® Partner® water heater, but information labels may be hidden.

3. Recommended top or vertical clearance is 12” minimum.

4. Refer to boiler manual for boiler clearances.

5. See Figure 1.1 for recommended service clearances.

---

**Figure 1.1: Recommended Clearances**
2. INSTALLATION – PIPING

A. TEMPERATURE & PRESSURE (T&P) RELIEF VALVE

⚠️ CAUTION

To reduce risk of excessive pressures and temperatures in the water heater, install temperature and pressure protective equipment required by local codes, but no less than a combination temperature and pressure relief valve certified by a nationally recognized testing laboratory that maintains periodic inspection of production of listed equipment or materials, as meeting the requirements for Relief Valves and Automatic Gas Shutoff Devices for Hot Water Supply Systems, ANSI Z21.22. This valve must be marked with a maximum working pressure of the water heater.

1. Every Peerless® Partner® water heater must be protected with a T&P relief valve.

2. Determine T&P relief valve size by the following specifications, unless they conflict with local codes:
   a. Peerless® Partner® 30/40/50: 3/4" NPT with an AGA Rating of 100,000 BTU/hr and a maximum pressure rating of 150 psig. (Watts 100XL-8 or equivalent).
   b. Peerless® Partner® 60/80/100/120: 3/4" NPT with an AGA Rating of 200,000 BTU/hr and a maximum pressure rating of 150 psig. (Watts 40XL-8 or equivalent).

3. Standard Installation:
   Install T&P relief valve in the Auxiliary connection located behind the air vent on the top of the water heater (Figure 3.1).
   or
   Install the T&P relief valve in the run (straight through leg) of a tee located at the domestic hot water outlet when using the Auxiliary connection for a recirculation return (Figure 3.2).

4. Commonwealth of Massachusetts Installation:
   Follow this procedure for jurisdictions requiring a vacuum breaker to be installed on the domestic cold water inlet.
   • Install the T&P in the run (straight through leg) of tee located at the domestic hot water outlet. Use a long element T&P relief valve (Fig. 3.4).

5. T&P Relief Valve Discharge Piping:
   T&P relief valve discharge piping must be:
   • made of material serviceable for temperatures of 250°F or greater.
   • directed so that hot water flows away from all persons.
   • directed to a suitable place for disposal.
   • installed so as to allow complete draining of the T&P relief valve and discharge line.

   T&P relief valve discharge piping must not be:
   • excessively long. Using more than 2 elbows or 15 feet of piping can reduce discharge capacity.
   • directly connected to a drain. Terminate the discharge piping within 6’ from a drain and within 6’ of the floor. Refer to local codes.
   • plugged, reduced or restricted.
   • subject to freezing.

⚠️ WARNING

Do not install any valve between T&P relief valve and tank connection or on T&P relief valve discharge piping. Do not plug T&P relief valve or discharge piping. Improper placement and piping of T&P relief valve can cause severe personal injury, death or substantial property damage.

B. DRAIN VALVE

Drain valve and fittings are supplied by others.

1. Standard Installation
   a. Install a tee connection at the domestic cold water inlet (Fig. 3.1 and 3.2).
   b. Pipe the drain piping with drain valve from the tee connection to:
      i. a suitable place for disposal
      or
      ii. terminate within 12” of the floor

2. Commonwealth of Massachusetts Installation
   a. Use the drain tube assembly supplied in the tank carton.
   b. Thread a 3/4” close nipple onto the Auxiliary connection and insert an open-end dip tube into the Auxiliary connection on top of water heater. As shown in Fig. 3.3.
   c. Install a 3/4” NPT elbow to the Auxiliary connection, see Fig. 3.4.
   d. Pipe the drain piping with drain valve from the elbow connection to:
i. a suitable place for disposal
or
ii. terminate within 12” of the floor

C. AUTOMATIC AIR VENT

1. Remove plastic shipping cap from 1/2” NPT pipe fitting on top center of water heater.
2. Install 1/2” x 1/8” reducer bushing provided with water heater, using suitable pipe dope or tape.
3. Install automatic air vent provided with water heater, using suitable pipe dope or tape.
4. Unscrew vent cap on air vent one full turn. Leave cap unscrewed one turn for normal venting.

D. THERMAL EXPANSION

If a backflow preventer, check valve or pressure reducing valve is piped on cold water supply piping of water heater, install an expansion tank on cold water supply line to prevent normal thermal expansion from repeatedly forcing open T&P relief valve.

TAKE CAUTION

T&P relief valve is not intended for constant duty, such as relief of pressure due to repeated normal system expansion. Correct this condition by installing a properly sized expansion tank in domestic water system. Refer to expansion tank manufacturer’s installation instructions for proper sizing.

E. WATER HAMMER

Dishwashers, clothes washers and fast-closing positive shut-off valves incorporated in the system all contribute to creating water shock. Install a water hammer arrester to prevent damage to pipes and appliances. See device manufacturer’s instructions for application and installation.

TAKE NOTICE

Water hammering within the domestic piping system can cause premature failure of the inner tank of the water heater. This type of failure is NOT covered under warranty.

F. VACUUM BREAKER

Installing a vacuum breaker Watts N36-M1 or equivalent on the domestic cold water inlet will prevent damage to the inner tank if a negative pressure is developed in the domestic supply line. See manufacturer’s instructions for application and installation of the vacuum breaker.

G. GENERAL PIPING

1. For domestic water piping diagrams, see Figures 3.1 through 3.4.
2. See Figures 3.5 through 3.9 for boiler water piping
3. See Figures 3.10 and 3.11 for multiple water heater domestic piping.
4. See Figure 3.12 for multiple water heater boiler piping.
5. See Table 1.1 for domestic and boiler piping connection sizes.
6. All plumbing must meet or exceed all local, state and national plumbing codes.
7. Use pipe dope or tape suitable for potable water systems.
8. Use isolation valves to isolate system components.

H. DOMESTIC PIPING

1. Union on domestic hot water outlet should be piped at a higher elevation than domestic water drain valve. This will make draining the water heater easier.
2. Install unions for easy removal of water heater. Use dielectric unions or couplings to protect hot and cold water fittings from corrosion when connecting dissimilar materials such as copper and galvanized iron pipe.
3. If copper pipe is used for domestic water connections, first solder pipe to a threaded adapter and then screw adapter into cold water inlet on top of water heater. Inlet contains an internal plastic dip tube which can be damaged by heat from soldering.

</tbody>
</table>
4. When the water supply pressure is higher than 70 psig, it is recommended to install a pressure reducing valve on cold water supply line to prevent water loss through T&P relief valve.

5. If water heater will replace tankless coil in boiler, disconnect piping to coil. Allow water to drain from coil. Do not plug tankless coil.

I. THERMOSTATIC MIXING VALVE

1. It is recommended to install an optional mixing valve on the domestic hot water outlet.

2. Mixing valve should comply with ASSE 1017.

J. RECIRCULATION PIPING

1. T&P relief valve must be installed in run (straight through leg) of tee located at domestic hot water outlet of water heater.

2. It is recommended that the recirculation dip tube be installed in auxiliary connection using a close nipple assembly as shown Fig. 3.3, page 9. See Table 1.1 page 6 for diameter and length of dip tube.

3. A stainless steel or bronze circulator is recommended.

4. Install automatic mixing valve either at the hot water outlet of water heater or each hot water faucet.

K. MULTIPLE WATER HEATER SYSTEMS

1. Parallel Pipe Recirculation Systems - Manifold recirculation return to all water heaters.

2. Series Piped Systems - Piped return to the leading (cold water inlet) water heater.

3. Install automatic mixing valve either at the hot water outlet of water heater or each hot water faucet.

L. BOILER PIPING

1. If plastic pipe is used for boiler water piping, it must have a maximum oxygen diffusion rate of 0.1 mg/liter-day for boiler and water heater protection.

2. Boiler water (including additives) must be practically non-toxic, having toxicity rating or class of 1, as listed in Clinical Toxicology of Commercial Products.

   If antifreeze is used in boiler system, local codes may require a backflow preventer on cold water supply line. Use antifreeze specifically intended for hydronic heating systems. Inhibited propylene glycol is recommended at a maximum 50/50 mixture.

**NOTICE**

The Peerless® Partner® IDWH must be installed on a closed type hydronic system. Failure to provide such a system will result in premature failure of the outer tank and annulment of warranty.

**WARNING**

Do not use automotive, ethylene glycol or petroleum-based antifreeze. Do not use any undiluted antifreeze. This can cause severe personal injury, death or substantial property damage.

(Refer to the PureFire® Installation, Maintenance, and Operations Manual for alternate piping configurations).

Figure 3.9: Peerless® Partner® Boiler Piping for Peerless® PureFire® Condensing Boilers
Note: Contact PB Heat for optional heat exchanger kit for “Double Wall” applications.
Figure 3.10: Multiple Peerless® Partner® Water Heater System Domestic Piping - Parallel

- Recommended for most applications.
- Any one water heater tank thermostat may be utilized to control system temperature.
- Install automatic mixing valve at either the hot water outlet of the water heater system or at each hot water fixture.
- Each tank should be piped with a drain as shown in Figure 3.1.

Figure 3.11: Multiple Peerless® Partner® Water Heater System Domestic Piping - Series

- Recommended for applications in which there is a large water consumption in short period of time.
- A maximum of 3 water heaters may be piped in series.
- Utilize the lead (hot water outlet) Peerless® Partner® tank thermostat to control system temperature.
- Install automatic mixing valve at either the hot water outlet of the water heater system or at each hot water fixture.
- Each tank should be piped with a drain as shown in Figure 3.1.
Figure 3.12: Recommended Multiple Peerless® Partner® Boiler Piping (Reverse Return)
A. WIRING REQUIREMENTS

1. All wiring must be a minimum of 18 gauge and installed in accordance with:
   a. U.S.A. - National Electrical Code and any other national, state or local code requirements having jurisdiction.
   b. Canada - C.S.A. C22.1 Canadian Electrical Code Part 1 and any other national, provincial and local code requirements having jurisdiction.

2. If original wire supplied with appliance must be replaced, Type 90ºC or its equivalent must be used.

3. Refer to control component instructions packed with boiler for application information.

4. An optional service switch may be installed in water heater electrical circuit. This switch would only shut off the water heater, not the home heating system. Do not shut off water heater if there is a chance of freezing.

5. All electrical contacts shown do not have power applied - off the shelf condition. See Figures 5.1 through 5.9.

B. CIRCULATORS

Priority relay must be sized for total amp draw of all circulators.

C. ZONE VALVES

Transformer must be sized for maximum load of all zone valves.

D. SNAP SET CONNECTION

1. For easy wiring between water heater thermostat and boiler controls see Installation Wiring section Figures 5.1 through 5.9.

2. Make sure snap set is firmly snapped together after wiring.

WARNING
Electrical shock hazard can cause severe personal injury, death or substantial property damage. Disconnect power before installing and/or servicing.

4. INSTALLATION – WIRING
5. INSTALLATION – WIRING DRAWINGS

**Figure 5.1: Typical 4-Wire Zone Valve Zoning, With Domestic Priority**

**Figure 5.2: Typical 3-Wire Zone Valve Zoning, With Domestic Priority**

*Use isolation relay on 3-wire zone valves with non-isolated end switches. Transformer and boiler control can burn out if isolation relay is not used.*

Figure 5.5: Typical Circulator Zoning With Domestic Priority

Figure 5.6: Typical Circulator Zoning Without Domestic Priority
Figure 5.7: Circulator Zoning Without Domestic Priority, Series MI

Notes:
1. All wiring must comply with applicable codes, ordinances and regulations.
2. Wire remainder of aquastat relay in accordance with system wiring diagram supplied.

Legend:
- - - - LINE VOLTAGE
- - - - LOW VOLTAGE

Figure 5.8: Circulator Zoning Without Domestic Priority, Series WBV/WV, WV-DV, EC, SC

Notes:
1. Wire as shown for proper operation of boiler switch. Verify at start-up that boiler switch shuts down boiler.
2. Maximum total load of zone relays and additional circulators is 7.4 amps (typically 4 zones).
3. All wiring must comply with applicable codes, ordinances and regulations.
Note: Maximum of 4 total circulator zone when wiring 1 zone for priority.
6. WATER HEATER START-UP

A. FILLING THE INNER (DOMESTIC WATER) TANK

**CAUTION**

Never use water heater unless inner and outer tanks are completely filled with water. Inner tank must be completely filled and pressurized before pressurizing outer tank.

1. Close domestic water drain valve.
2. Open domestic water isolation valves for water heater.
3. Vent air from inner (domestic water) tank by opening nearest hot water faucet. Fill domestic water tank completely by allowing water to run until there is a constant flow of water.

B. FILLING THE OUTER (BOILER WATER) TANK

**CAUTION**

Never use water heater unless inner and outer tanks are completely filled with water. Inner tank must be completely filled and pressurized before pressurizing outer tank.

1. Close boiler water drain valve at boiler water outlet of water heater.
2. Open water heater’s boiler water isolation valves.
3. Allow air to escape from outer (boiler water) tank by opening vent cap A on automatic air vent, located on top of water heater. See Figure 6.1.
4. Follow instructions furnished with boiler to fill with water.
5. When tank is full, air will stop escaping, and the automatic air vent will close. If air vent does not seat properly (water leaks out), remove cap A. Briefly push in valve B and release it to clean valve seat. Screw cap A on completely, then unscrew one turn. See Figure 6.1.

**NOTICE**

For proper operation of the water heater, be sure the top cap is tightened at all times.

6. If antifreeze is used in boiler water, check concentration. Boiler water (including additives) must be practically non-toxic, having toxicity rating or class of 1, as listed in Clinical Toxicology of Commercial Products.

- Install an automatic mixing valve at water

**WARNING**

Do not use automotive, ethylene glycol or petroleum-based antifreeze. Do not use any undiluted antifreeze. This can cause severe personal injury, death or substantial property damage.

**DANGER**

HOT WATER CAN SCALD!

- Water temperatures over 125°F can cause severe burns instantly, or death from scalds.
- Feel water before bathing or showering.
- Consumer Product Safety Commission and some states recommend temperatures settings of 130°F or less. Setting thermostat higher than 130°F will increase risk of scald injury and cause severe personal injury or death.
- Water heated to a temperature suitable for clothes washing, dish washing and other sanitizing needs will scald and cause permanent injury.
- Children and elderly, infirm, or physically handicapped persons are more likely to be injured by hot water. Never leave them unattended in or near a bathtub. If anyone using hot water in the building fits this description, or if state laws or local codes require certain water temperatures at hot water faucets, take special precautions.
C. GENERAL NOTES

- Household water usage patterns will affect water temperature at any faucet or shower. Occasionally check temperature at each point of use, then adjust thermostat accordingly. Always recheck temperature after adjusting thermostat.

- When hot water is used in repeated small quantities, a “stacking” effect can develop in the water heater. The upper layer of water in tank can be hotter than lower layer.

- Lowering the thermostat setting or installing automatic mixing valves as indicated in these instructions will reduce water temperature levels. Consult your installer or service technician.

D. ADJUSTING THE WATER HEATER THERMOSTAT

Water heater thermostat is factory set to its lowest temperature. This may or may not be suitable for your needs.

- Turn thermostat knob clockwise ⇋ to increase water temperature.
- Turn thermostat knob counter-clockwise ⇋ to decrease water temperature.

C. GENERAL NOTES

- Measure water temperature at a hot water faucet immediately after first heating cycle. Further temperature adjustment may be necessary as water heating system is used. Recheck water temperature at faucet after adjustment.

- When adjusting thermostat, be sure boiler limit control is set a minimum of 20°F higher.

WARNING

Studies have indicated that dangerous bacteria, including legionella, pneumophila, can form in the potable water distribution system if certain minimum water temperatures are not maintained. Contact your local health department for more information.

- Measure water temperature at a hot water faucet immediately after first heating cycle. Further temperature adjustment may be necessary as water heating system is used. Recheck water temperature at faucet after adjustment.

- When adjusting thermostat, be sure boiler limit control is set a minimum of 20°F higher.

WARNING

At no time should boiler limit control be set above 210°F. This can cause severe personal injury, death or substantial property damage if ignored.

DANGER

HOT WATER CAN SCALD!

- Install an automatic mixing valve at water heater or at each hot water faucet, bath and shower outlet. Selection and installation must comply with valve manufacturer’s recommendation and instructions.

- Use the lowest practical temperature setting.

- Measure water temperature at hot water faucet after any adjustment. You must follow “Adjusting the Water Heater Thermostat” procedures.

WARNING

HOT WATER CAN SCALD!

- Install an automatic mixing valve at water heater or at each hot water faucet, bath and shower outlet. Selection and installation must comply with valve manufacturer’s recommendation and instructions.

- Use the lowest practical temperature setting.

- Measure water temperature at hot water faucet after any adjustment. You must follow “Adjusting the Water Heater Thermostat” procedures.

Figure 6.2: Peerless® Partner® Knob
A. MAINTENANCE SCHEDULE

Annual service by qualified service technician should include the following:

1. Any procedure required by local codes.
2. Check air vent operation.
3. Verify system pressure. Air venting procedure may require adding water to bring system up to pressure, typically 12 psig.
4. Manually operate T&P relief valve at least once a year. This will release some hot water.
5. Move operating lever to open position for a few seconds and then move it back, allowing it to snap closed. After T&P relief valve is operated, if it continues to release water, close cold water inlet to water heater immediately. Follow draining instructions, and replace T&P relief valve. If T&P relief valve weeps periodically, it may be due to thermal expansion. See Thermal Expansion, page 5. Do not plug T&P relief valve or discharge piping.
6. Follow instructions on circulator to oil it, if required.
7. Check mixing valve, valves, pipes and fittings for leaks.
8. Check function of field-installed controls and valves. See component manufacturer’s instructions.
9. Review homeowner’s maintenance responsibilities and their frequencies, including any not listed in the following section.

Homeowner monthly maintenance to include:

- Check air vent operation.
  Automatic air vent - remove cap. Briefly push in valve and release it to clean valve seat. Screw cap on completely, then unscrew one full turn. If air vent does not operate, call qualified service technician.
- Visually check valves, pipes and fittings for leaks. Call qualified service technician to repair leaks.

B. FILLING WATER HEATER

See “Filling the Inner (Domestic Water) Tank and “Filling the Outer (Boiler Water) Tank” on in Section 6.A and 6.B.

C. DRAINING WATER HEATER

Drain water heater if it will be shut off and exposed to freezing temperatures. Freezing water will expand and damage water heater.

- If boiler water contains sufficient antifreeze, then only the domestic water needs to be drained.

WARNING

Close boiler water isolation valves and relieve system pressure to below 15 psig in outer tank before draining inner tank to prevent damage to inner tank.

- If boiler water does not contain sufficient antifreeze, then the boiler water and domestic water must be drained.

If antifreeze is used in boiler water, check concentration. Boiler water (including additives) must be practically nontoxic, having toxicity rating or class of 1, as listed in Clinical Toxicology of Commercial Products. A maximum 50/50 mixture of inhibited propylene glycol is recommended. Follow antifreeze manufacturer’s instruction.

WARNING

Do not use automotive, ethylene glycol or petroleum-based antifreeze. Do not use any undiluted antifreeze. This can cause severe personal injury, death or substantial property damage.

WARNING

Water from opened drain valves, unions and other connections may be extremely hot. To avoid severe personal injury, death or substantial property damage:
- Tighten all drain hose connections.
- Direct hot water away from all persons.
D. DRAINING INNER (DOMESTIC WATER) TANK
(See Domestic Piping Fig. 3.1)

1. Disconnect snap set wiring connection at water heater.
   a. If outer (boiler water) tank pressure is greater than 15 psig, relieve boiler pressure and close isolation valves before proceeding.

2. Close system supply isolation valve.

3. Connect a hose to domestic water drain valve at cold water inlet. Hose should extend to drain at floor level to allow siphoning of domestic water tank.

4. Open hot water faucet at highest point above heater.

5. Open domestic water drain valve to start siphoning.

6. When draining is complete, close hot water faucet and domestic water drain valve.

E. DRAINING OUTER (BOILER WATER) TANK

1. Disconnect snap set wiring connection at water.

2. Close boiler water isolation valves between boiler and water heater.

3. Connect hose to boiler water drain valve at water heater. Open and drain water to a safe place.

4. To speed draining procedure, loosen air vent on top of tank.

5. When draining is complete, close drain valve and retighten air vent.
